

# Package ‘bakerrr’

October 1, 2025

**Title** Background-Parallel Jobs

**Version** 0.1.0

**Description** Easily launch, track, and control functions as background-parallel jobs. Includes robust utilities for job status, error handling, resource monitoring, and result collection. Designed for scalable workflows in interactive and automated settings (local or remote). Integrates with multiple backends; supports flexible automation pipelines and live job tracking. For more information, see <<https://anirbanshaw24.github.io/bakerrr/>>.

**License** MIT + file LICENSE

**URL** <https://github.com/anirbanshaw24/bakerrr>

**BugReports** <https://github.com/anirbanshaw24/bakerrr/issues>

**Depends** R (>= 4.1.0)

**Imports** callr, carrier, cli, config, fs, glue, mirai, purrr, S7

**Suggests** covr, DT, htmltools, knitr, lintr, qpdf, rmarkdown, spelling, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Encoding** UTF-8

**Language** en-US

**RoxygenNote** 7.3.3

**NeedsCompilation** no

**Author** Anirban Shaw [aut, cre] (ORCID: <<https://orcid.org/0000-0003-4021-513X>>)

**Maintainer** Anirban Shaw <anirbanshaw24@gmail.com>

**Repository** CRAN

**Date/Publication** 2025-10-01 07:40:02 UTC

bakerrr

*S7 bakerrr class for job orchestration and background processing*

### Description

Defines the bakerrr S7 class for parallel and background job execution. Stores the function to run (fun), argument lists (args\_list), background job arguments (bg\_args), job objects, results, and runtime properties. Supports retrieval of job status/results and validation of provided properties.

### Usage

```
bakerrr(
  fun,
  args_list,
  bg_args = list(),
  n_daemons = ceiling(parallel::detectCores()/5),
  cleanup = TRUE
)
```

### Arguments

fun	Function to be executed for each job.
args_list	List of argument sets for each job.
bg_args	List of arguments passed to background job handler.
n_daemons	Number of parallel workers (default: ceiling of cores/5).
cleanup	Logical; whether to clean up jobs after execution (default: TRUE).

### Value

An S7 bakerrr class object with job orchestration methods and properties.

### Examples

```
# Create a bakerrr object to process jobs in parallel
bakerrr::bakerrr(fun = sum, args_list = list(list(1:10), list(10:20)))
```

---

**bg\_func***Background parallel processing of jobs using purrr and tryCatch*

---

**Description**

Executes a list of job specifications in parallel, applies the given function with error handling, and collects the results or error messages.

**Usage**

```
bg_func(jobs, n_daemons)
```

**Arguments**

jobs	A list of job specifications, each containing a function (fun) and arguments (args).
n_daemons	Number of parallel workers

**Value**

A list of results, with error messages in case of failure.

---

**print***Print method for bakerr S7 job objects*

---

**Description**

Displays a concise summary of the bakerr S7 job object, including current status, function name, number of argument sets, daemon count, cleanup setting, process status, and result summary. Outputs a status icon and key runtime information for quick inspection.

**Arguments**

x	A bakerr S7 job object.
...	Additional arguments (currently ignored).

**Value**

The input x, invisibly, after printing the summary.

`run_bg`*Generic for running background jobs in bakerrr***Description**

Initiates background execution for a bakerrr job object, launching jobs via `callr::r_bg`. Stores process status in `bg_job_status`.

**Usage**

```
run_bg(x, ...)
```

**Arguments**

- |                  |                                 |
|------------------|---------------------------------|
| <code>x</code>   | A bakerrr S7 job object.        |
| <code>...</code> | Not used. For future expansion. |

**Value**

The input `x`, invisibly, after launching background jobs.

`run_jobs`*Run bakerrr jobs and wait for completion***Description**

Launches the parallel jobs, manages daemon setup (`mirai::daemons`), initiates background jobs, provides a console spinner for progress, and optionally waits for results. Cleans up daemons after execution.

**Usage**

```
run_jobs(job, wait_for_results, ...)
```

**Arguments**

- |                               |  |
|-------------------------------|--|
| <code>job</code>              | A bakerrr S7 job object.   |
| <code>wait_for_results</code> | Logical; whether to block and wait for completion (default: TRUE). |
| <code>...</code>              | Not used. For future expansion.                                    |

**Value**

The updated bakerrr job object, invisibly.

---

**status***Status method for bakerrr S7 job objects*

---

**Description**

Returns job status as "waiting", "running", or "done".

**Usage**

```
status(x, ...)
```

**Arguments**

- |     |                              |
|-----|------------------------------|
| x   | A bakerrr S7 job object.     |
| ... | Further arguments (ignored). |

**Value**

One of "waiting", "running", "done".

---

**summary***Summary method for bakerrr S7 job objects*

---

**Description**

Provides a one-line summary of a bakerrr job object, indicating the status, function name, number of worker daemons, and total jobs. Prints a status icon and brief job info.

**Usage**

```
summary(x, ...)
```

**Arguments**

- |     |   |
|-----|---|
| x   | A bakerrr S7 job object.                  |
| ... | Additional arguments (currently ignored). |

**Value**

The input x, invisibly, after printing the summary.
