# Package 'RobStatTM' 

November 28, 2023
Version 1.0.8
Date 2023-11-27
Title Robust Statistics: Theory and Methods
Description Companion package for the book: ‘'Robust Statistics: Theory and Methods, second edition", [http://www.wiley.com/go/maronna/robust](http://www.wiley.com/go/maronna/robust). This package contains code that implements the robust estimators discussed in the recent second edition of the book above, as well as the scripts reproducing all the examples in the book.

Depends R (>= 3.5.0)
Imports stats, pyinit, rrcov, robustbase
Suggests R.rsp
LazyData yes
License GPL (>=3)
RoxygenNote 7.2.3

alcohol Alcohol data

## Description

This data set contains physicochemical characteristics of 44 aliphatic alcohols. The aim of the experiment was the prediction of the solubility on the basis of molecular descriptors.

## Usage

data(alcohol)

## Format

An object of class "data.frame".

## Details

Format: 44 cases and 7 continuous variables. The columns are: 1 . $\mathrm{SAG}=$ solvent accessible surfacebounded molecular volume 2. V=volume 3. $\log \mathrm{PC}(\mathrm{PC}=$ octanol-water partitions coefficient) 4. $\mathrm{P}=$ polarizability 5. RM=molar refractivity 6. Mass 7. $\log$ (Solubility) (response)

## Source

Romanelli, G.P., Martino, C.M. and Castro, E.A. (2001), Modeling the solubility of aliphatic alcohols via molecular descriptors, Journal of the Chemical Society of Pakistan, 23, 195-199.

## Examples

data(alcohol)
algae Algae data

## Description

Each row of the data set is a set of 90 measurements at a river in some place in Europe. There are 11 predictors. The response is the logarithm of the abundance of a certain class of algae. Description: The columns are: 1 . season, categorical ( $1,2,3,4$ for winter, spring, summer and autumn) 2 . river size (categorical) (1,2,3 for small, medium and large) 3. fluid velocity (categorical) ( $1,2,3$ for low, medium and high) 4-11 (numerci): content of nitrogen in the form of nitrates, nitrites and ammonia, and other chemical compounds. Col. 12 ia the response: abundance of a type of algae (type 6 in the complete file). For simplicity we deleted the rows with missing values and took the logarithm of the response.

## Usage

data(algae)

## Format

An object of class "data.frame".

## Details

Format 90 rows, 12 columns ( 3 categorical, 9 numeric)

## Source

Hettich, S. and Bay, S.D. (1999), The UCI KDD Archive http://kdd.ics.uci.edu. Irvine, CA: University of California, Department of Information and Computer Science.

## Examples

```
data(algae)
```

biochem Biochem data

## Description

Two biochemical measurements on 12 men with similar weights.

## Usage

data(biochem)

## Format

An object of class "data.frame".

## Details

Format: Numeric, 12 rows, two columns

## Source

Seber, G.A.F. (1984), Multivariate Observations. New York: John Wiley.

## Examples

```

bisquare Tuning parameter the rho loss functions

## Description

This function computes the tuning constant that yields an MM-regression estimator with a desired asymptotic efficiency when computed with a rho function in the corresponding family. The output of this function can be passed to the functions lmrobdet.control, mscale and rho.

## Usage

bisquare(e)

## Arguments

e
the desired efficiency of the corresponding regression estimator for Gaussian errors

## Value

A length- 1 vector with the corresponding tuning constant.

## Author(s)

Kjell Konis

## Examples

\# Tuning parameters for an 85\%-efficient M-estimator at a Gaussian model
bisquare(.85)
breslow.dat Breslow Data

## Description

Patients suffering from simple or complex partial seizures were randomized to receive either the antiepileptic drug progabide or a placebo. At each of four successive post randomization clinic visits, the number of seizures occuring over the previous two weeks was reported.

## Usage

data(breslow.dat)

## Format

An object of class "data.frame".

## Details

Description: A data frame with 59 observations on the following 12 variables: ID: an integer value specifying the patient identification number; Y 1 : an integer value, the number of seizures during the first two week period; Y : an integer value, the number of seizures during the second two week period; Y3: an integer value, the number of seizures during the third two week period. Y4: an integer value, the number of seizures during the fourth two week period; Base: an integer value giving the eight-week baseline seizure count; Age: an integer value giving the age of the parient in years; Trt: the treatment: a factor with levels placebo and progabide; Ysum: an integer value, the sum of Y1, Y2, Y3 and Y4; sumY: an integer value, the sum of Y1, Y2, Y3 and Y4; Age10: a numeric value, Age divided by 10; Base4: a numeric value, Base divided by 4.
Format: Numeric, 59 rows and 12 columns.

## Examples

data(breslow.dat)
bus Bus data

## Description

This data set corresponds to a study in automatic vehicle recognition. Each of the 218 rows corresponds to a view of a bus silhouette, and contains 18 attributes of the image. It was decided to exclude variable 9 and divide the remaining variables by their MADN's.

## Usage

data(bus)

## Format

An object of class "data. frame".

## Details

Description: The following features were extracted from the silhouettes. 1. compactness 2. circularity 3 . distance circularity 4 . radius ratio 5 . principal axis aspect ratio 6 . maximum length aspect ratio 7. scatter ratio 8 . elongatedness 9 . principal axis rectangularity 10 . maximum length rectangularity 11 . scaled variance along major axis 12 . scaled variance along minor axis 13 . scaled radius of gyration 14. skewness about major axis 15 . skewness about minor axis 16 . kurtosis about minor axis 17. kurtosis about major axis 18. hollows ratio

Format: Numeric, 218 rows and 18 columns.

## Source

Hettich, S. and Bay, S.D. (1999), The UCI KDD Archive http://kdd.ics.uci.edu. Irvine, CA: University of California, Department of Information and Computer Science.

## Examples

```
data(bus)
```

## Description

The estimated covariance matrix of the DCML regression estimator. This function is used internally and not meant to be used directly.

## Usage

cov.dcml(res.LS, res.R, CC, sig.R, t0, p, n, control)

## Arguments

| res.LS | vector of residuals from the least squares fit |
| :--- | :--- |
| res.R | vector of residuals from the robust regression fit |
| CC | estimated covariance matrix of the robust regression estimator |
| sig.R | robust estimate of the scale of the residuals |
| t0 | mixing parameter |
| p,n | the dimensions of the problem, needed for the finite sample correction of the <br> tuning constant of the M-scale |
| control | a list of control parameters as returned by lmrobdet.control |

## Value

The covariance matrix estimate.

## Author(s)

Victor Yohai, [victoryohai@gmail.com](mailto:victoryohai@gmail.com)

```
covClassic Classical Covariance Estimation
```

## Description

Compute an estimate of the covariance/correlation matrix and location vector using classical methods.

```
Usage
    covClassic(
        data,
        corr = FALSE,
        center = TRUE,
        distance = TRUE,
        na.action = na.fail,
        unbiased = TRUE
    )
```

## Arguments

| data | a numeric matrix or data frame containing the data. |
| :--- | :--- |
| corr | a logical flag. If corr = TRUE then the estimated correlation matrix is computed. |
| center | a logical flag or a numeric vector of length $p$ (where $p$ is the number of columns <br> of x) specifying the center. If center = TRUE then the center is estimated. Oth- <br> erwise the center is taken to be 0. |
| distance | a logical flag. If distance = TRUE the Mahalanobis distances are computed. <br> na.actiona function to filter missing data. The default na. fail produces an error if miss- <br> ing values are present. An alternative is na. omit which deletes observations <br> that contain one or more missing values. |
| unbiased | a logical flag. If TRUE the unbiased estimator is returned (computed with de- <br> nominator equal to $n-1$ ), else the MLE (computed with denominator equal to $n$ ) <br> is returned. |

## Details

Its main intention is to return an object compatible to that produced by covRob, but fit using classical methods.

## Value

a list with class "covClassic" containing the following elements:
center a numeric vector containing the estimate of the location vector.
cov a numeric matrix containing the estimate of the covariance matrix.
cor a numeric matrix containing the estimate of the correlation matrix if the argument corr = TRUE. Otherwise it is set to NULL.
dist a numeric vector containing the squared Mahalanobis distances. Only present if distance $=$ TRUE in the call.
call an image of the call that produced the object with all the arguments named. The matched call.

## Note

Originally, and in S-PLUS, this function was called cov; it has been renamed, as that did mask the function in the standard package stats.

## Examples

```
data(wine)
round( covClassic(wine)$cov, 2)
```

covRob Robust multivariate location and scatter estimators

## Description

This function computes robust estimators for multivariate location and scatter.

## Usage

```
covRob(X, type = "auto", maxit = 50, tol = 1e-04, corr = FALSE)
```

## Arguments

| X | a data matrix with observations in rows. |
| :--- | :--- |
| type | a string indicating which estimator to compute. Valid options are "Rocke" for <br> Rocke's S-estimator, "MM" for an MM-estimator with a SHR rho function, or <br> "auto" (default) which selects "Rocke" if the number of variables is greater than <br> or equal to 10, and "MM" otherwise. |
| maxit | Maximum number of iterations, defaults to 50. |
| tol | Tolerance for convergence, defaults to 1e-4. |
| corr | A logical value. If TRUE a correlation matrix is included in the element cor of <br> the returned object. Defaults to FALSE. |

## Details

This function computes robust estimators for multivariate location and scatter. The default behaviour (type = "auto") computes a "Rocke" estimator (as implemented in covRobRocke) if the number of variables is greater than or equal to 10, and an MM-estimator with a SHR rho function (as implemented in covRobMM) otherwise.

## Value

A list with class "covClassic" with the following components:
center The location estimate.
cov The scatter matrix estimate, scaled for consistency at the normal distribution.
cor The correlation matrix estimate, if the argument cor equals TRUE. Otherwise it is set to NULL.
dist Robust Mahalanobis distances
wts weights

| call | an image of the call that produced the object with all the arguments named. The |
| :--- | :--- |
| matched call. |  |
| mu | The location estimate. Same as center above. |
| V | The scatter matrix estimate, scaled for consistency at the normal distribution. <br> Same as cov above. |

X1 <- X0[,-9]
tmp <- covRob(X1)
round(tmp$cov[1:10, 1:10], 3)
tmp$mu
```

covRobMM

MM robust multivariate location and scatter estimator

## Description

This function computes an MM robust estimator for multivariate location and scatter with the "SHR" loss function.

## Usage

covRobMM(X, maxit $=50$, tolpar $=1 \mathrm{e}-04$, corr $=$ FALSE $)$

## Arguments

X
maxit
tolpar
corr A logical value. If TRUE a correlation matrix is included in the element cor of the returned object. Defaults to FALSE.

## Details

This function computes an MM robust estimator for multivariate location and scatter with the "SHR" loss function.

## Value

A list with class "covRob" containing the following elements
center The location estimate.
cov The scatter matrix estimate, scaled for consistency at the normal distribution. Same as $\vee$ above.
cor The correlation matrix estimate, if the argument cor equals TRUE. Otherwise it is set to NULL.
dist Robust Mahalanobis distances
wts weights
call an image of the call that produced the object with all the arguments named. The matched call.
mu The location estimate. Same as center above.
$\checkmark \quad$ The scatter or correlation matrix estimate, scaled for consistency at the normal distribution

## Author(s)

Ricardo Maronna, [rmaronna@retina.ar](mailto:rmaronna@retina.ar)

## References

http://www.wiley.com/go/maronna/robust

## Examples

```
data(bus)
X0 <- as.matrix(bus)
X1 <- X0[,-9]
tmp <- covRobMM(X1)
round(tmp$cov[1:10, 1:10], 3)
tmp$mu
```

## Description

This function computes Rocke's robust estimator for multivariate location and scatter.

## Usage

```
covRobRocke(
        X,
        initial = "K",
        maxsteps = 5,
        propmin = 2,
        qs = 2,
        maxit = 50,
        tol = 1e-04,
        corr = FALSE
    )
```

## Arguments

$X \quad$ a data matrix with observations in rows.
initial A character indicating the initial estimator. Valid options are ' K ' (default) for the Pena-Prieto 'KSD' estimate, and 'mve' for the Minimum Volume Ellipsoid.
maxsteps Maximum number of steps for the line search section of the algorithm.
propmin Regulates the proportion of weights computed from the initial estimator that will be different from zero. The number of observations with initial non-zero weights will be at least $p$ (the number of columns of $X$ ) times propmin.
qs Tuning paramater for Rocke's loss functions.
maxit Maximum number of iterations.
tol Tolerance to decide converngence.
corr A logical value. If TRUE a correlation matrix is included in the element cor of the returned object. Defaults to FALSE.

## Details

This function computes Rocke's robust estimator for multivariate location and scatter.

## Value

A list with class "covRob" containing the following elements:

| center | The location estimate. |
| :--- | :--- |
| cov | The scatter matrix estimate, scaled for consistency at the normal distribution. |

| cor | The correlation matrix estimate, if the argument cor equals TRUE. Otherwise it <br> is set to NULL. |
| :--- | :--- |
| dist | Robust Mahalanobis distances. |
| wts | weights |
| call | an image of the call that produced the object with all the arguments named. The <br> matched call. |
| mu | The location estimate. Same as center above. |
| V | The scatter (or correlation) matrix estimate, scaled for consistency at the normal <br> distribution. Same as cov above. |
| sig | sig |
| gamma | Final value of the constant gamma that regulates the efficiency. |

## Author(s)

X1 <- X0[,-9]
tmp <- covRobRocke(X1)
round(tmp$cov[1:10, 1:10], 3)
tmp$mu
```

DCML

## Description

This function computes the DCML regression estimator. This function is used internally by lmrobdetDCML, and not meant to be used directly.

## Usage

DCML (x, y, z, z0, control)

## Arguments

$x \quad$ design matrix
$\mathrm{y} \quad$ response vector
z robust fit as returned by MMPY or SMPY
z0 least squares fit as returned by lm.fit
control a list of control parameters as returned by lmrobdet.control

## Value

a list with the following components
coefficients the vector of regression coefficients
cov the estimated covariance matrix of the DCML regression estimator
residuals the vector of regression residuals from the DCML fit
scale a robust residual (M-)scale estimate
t0 the mixing proportion between the least squares and robust regression estimators

## Author(s)

## See Also

DCML, MMPY, SMPY
drop1.lmrobdetMM $\quad$ RFPE of submodels of an lmrobdetMM fit

## Description

This function computes the RFPE for the MM-estimators obtained with lmrobdetMM by recomputing it, successively removing each of a number of specified terms. It is used internally by step. ImrobdetMM and not meant to be used directly.

## Usage

```
## S3 method for class 'lmrobdetMM'
drop1(object, scope, scale, keep, ...)
```

## Arguments

object the MM element (of class lmrob) in an object of class lmrobdetMM.
scope an optional formula giving the terms to be considered for dropping. Typically this argument is omitted, in which case all possible terms are dropped (without breaking hierarchy rules). The scope can also be a character vector of term labels. If the argument is supplied as a formula, any . is interpreted relative to the formula implied by the object argument.
scale an optional residual scale estimate. If missing the residual scale estimate in object is used.
keep a character vector of names of components that should be saved for each subset model. Only names from the set "coefficients", "fitted" and "residuals" are allowed. If keep $==$ TRUE, the complete set is saved. The default behavior is not to keep anything.
... additional parameters to match generic method drop1

## Value

An anova object consisting of the term labels, the degrees of freedom, and Robust Final Prediction Errors (RFPE) for each subset model. If keep is missing, the anova object is returned. If keep is present, a list with components "anova" and "keep" is returned. In this case, the "keep" component is a matrix of mode "list", with a column for each subset model, and a row for each component kept.

## fastmve

## Description

This function uses a fast algorithm to compute the Minimum Volume Ellipsoid (MVE) for multivariate location and scatter.

## Usage

fastmve (x, nsamp = 500)

## Arguments

X
nsamp data matrix ( $\mathrm{n} \times \mathrm{p}$ ) with cases stored in rows. number of random starts for the iterative algorithm, these are constructed using subsamples of the data.

## Details

This function computes the Minimum Volume Ellipsoid (MVE) for multivariate location and scatter, using a fast algorithm related to the fast algorithm for S-regression estimators (see lmrob).

## Value

A list with the following components:

| center | a vector with the robust multivariate location estimate |
| :--- | :--- |
| cov | a matrix with the robust covariance / scatter matrix estimate |
| scale | A scalar that equals the median of the mahalanobis distances of the data to the <br> center, multiplied by the determinant of the covariance matrix to the power 1/p |
| best | Indices of the observations that correspond to the MVE estimator |
| nsamp | Number of random starts used for the iterative algorithm |
| nsing | Number of random subsamples (among the nsamp attempted) that failed (result- <br> ing in singular initial values) |

## initPP Robust multivariate location and scatter estimators

## Description

This function computes robust multivariate location and scatter estimators using both random and deterministic starting points.

## Usage

initPP(X, muldirand $=20$, muldifix $=10$, dirmin $=1000$ )

## Arguments

$X \quad$ a data matrix with observations in rows.
muldirand used to determine the number of random directions (candidates), which is max ( $p * m u l d i r a n d$, dirmin), where $p$ is the number of columns in $X$.
muldifix used to determine the number of random directions (candidates), which is min( $n$, $2 * m u l d i f i x * p$ ).
dirmin minimum number of random directions

## Details

This function computes robust multivariate location and scatter using both Pen~a-Prieto and random candidates.

## Value

A list with the following components:

| idx | A zero/one vector with ones in the positions of the suspected outliers |
| :--- | :--- |
| disma | Robust squared Mahalanobis distances |
| center | Robust mean estimate |
| cova | Robust covariance matrix estimate |
| t | Outlyingness of data points |

tmp$center
```

INVTR2 Robust $R^{\wedge} 2$ coefficient of determination

## Description

This function computes a robust version of the $\mathrm{R}^{\wedge} 2$ coefficient of determination. It is used internally by lmrobdetMM, and not meant to be used directly.

## Usage

INVTR2(RR2, family, cc)

## Arguments

RR2 the proportional difference in loss functions (a naive robust $\mathrm{R}^{\wedge} 2$ coefficient).
family family string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt").
cc tuning parameters to be computed according to efficiency and / or breakdown considerations. See lmrobdet.control, bisquare, mopt and opt.

## Details

This function computes a robust version of the $\mathrm{R}^{\wedge} 2$ coefficient. It is used internally by lmrobdetMM, and not meant to be used directly.

## Value

An unbiased version of the robust $\mathrm{R}^{\wedge} 2$ coefficient of determination.

An object of class "data.frame".

## Details

Description: The following features are present: wbc: white blood cell count; ag: presence or absence of a certain morphological characteristic in the white cells; and $y$ : binary response variable, equals 1 if the patient survives more than 52 weeks, 0 otherwise.
Format: Numeric, 33 rows and 3 columns.

## Source

Cook, R.D. and Weisberg, S. (1982). Residuals and Influence in Regression, Chapman and Hall; Johnson, W. (1985), Influence measures for logistic regression: another point of view, Biometrika, 72, 59-65.

## Examples

```
data(leuk.dat)
```

## Description

This function sets tuning parameters for the MM estimator implemented in lmrobdetMM and the Distance Constrained Maximum Likelihood regression estimators computed by lmrobdetDCML.

## Usage

lmrobdet. control(

```
        bb = 0.5,
```

        efficiency \(=0.95\),
        family = "mopt",
        tuning.psi,
        tuning.chi,
        compute.rd = FALSE,
        corr.b = TRUE,
        split.type = "f",
        initial = "S",
        max.it \(=100\),
        refine.tol \(=1 \mathrm{e}-07\),
        rel.tol \(=1 \mathrm{e}-07\),
        refine.S.py \(=1 e-07\),
        refine. \(\mathrm{PY}=10\),
        solve.tol = 1e-07,
        trace.lev = 0,
        psc_keep \(=0.5\),
        resid_keep_method = "threshold",
        resid_keep_thresh = 2,
        resid_keep_prop = 0.2,
        py_maxit = 20,
        py_eps \(=1 \mathrm{e}-05\),
        mscale_maxit \(=50\),
        mscale_tol = 1e-06,
        mscale_rho_fun = "bisquare"
    )
    
## Arguments

bb
tuning constant (between 0 and $1 / 2$ ) for the M -scale used to compute the initial S-estimator. It determines the robusness (breakdown point) of the resulting MMestimator, which is bb. Defaults to 0.5 .
efficiency desired asymptotic efficiency of the final regression M-estimator. Defaults to 0.95 .

| family | string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt"). Incomplete entries will be matched to the current valid options. Defaults to "mopt". |
| :---: | :---: |
| tuning.psi | tuning parameters for the regression M-estimator computed with a rho function as specified with argument family. If missing, it is computed inside lmrobdet. control to match the value of efficiency according to the family of rho functions specified in family. Appropriate values for tuning.psi for a given desired efficiency for Gaussian errors can be constructed using the functions bisquare, mopt and opt. |
| tuning.chi | tuning constant for the function used to compute the M-scale used for the initial S-estimator. If missing, it is computed inside lmrobdet. control to match the value of bb according to the family of rho functions specified in family. |
| compute.rd | logical value indicating whether robust leverage distances need to be computed. |
| corr.b | logical value indicating whether a finite-sample correction should be applied to the M-scale parameter bb. |
| split.type | determines how categorical and continuous variables are split. See splitFrame. |
| initial | string specifying the initial value for the M-step of the MM-estimator. Valid options are 'S', for an S-estimator and 'MS' for an M-S estimator which is appropriate when there are categorical explanatory variables in the model. |
| max.it | maximum number of IRWLS iterations for the MM-estimator |
| refine.tol | relative convergence tolerance for the S-estimator |
| rel.tol | relative convergence tolerance for the IRWLS iterations for the MM-estimator |
| refine.S.py | relative convergence tolerance for the local improvements of the Pena-Yohai candidates for the S-estimator |
| refine.PY | number of refinement steps for the Pen~a-Yohai candidates |
| solve.tol | (for the S algorithm): relative tolerance for matrix inversion. Hence, this corresponds to solve. default's tol. |
| trace.lev | positive values (increasingly) provide details on the progress of the MM-algorithm |
| psc_keep | For pyinit, proportion of observations to remove based on PSCs. The effective proportion of removed observations is adjusted according to the sample size to be prosac*(1-p/n). See pyinit. |
| resid_keep_method |  |
|  | For pyinit, how to clean the data based on large residuals. If "threshold", all observations with scaled residuals larger than C.res will be removed, if "proportion", observations with the largest prop residuals will be removed. See pyinit. |
| resid_keep_thresh |  |
|  | See parameter resid_keep_method above. See pyinit. |
| resid_keep_prop |  |
|  | See parameter resid_keep_method above. See pyinit. |
| py_maxit | Maximum number of iterations. See pyinit. |
| py_eps | Relative tolerance for convergence. See pyinit. |

mscale_maxit Maximum number of iterations for the M-scale algorithm. See pyinit and mscale.
mscale_tol Convergence tolerance for the M-scale algorithm. See mscale and mscale.
mscale_rho_fun String indicating the loss function used for the M-scale. See pyinit.

## Details

The argument family specifies the name of the family of loss function to be used. Current valid options are "bisquare", "opt", "mopt", "optV0" and "moptV0". "mopt" is a modified version of the optimal psi function to make it strictly increasing close to 0 , and to make the corresponding weight function non-increasing.

## Value

A list with the necessary tuning parameters.

## Choice of Rho Loss Function

As of RobStatTM Versopm 1.0.7, the opt and mopt rhos functions are calculated using polynomials, rather than using the standard normal error function (erf) as in versions of RobStatTM prior to 1.0.7. The numerical results one now gets with the opt or mopt choices will differ by small amounts from those in earlier RobStatTM versions. Users who wish to replicate results from releases prior to 1.0.7 may do so using the family arguments family $=$ "optV0" or family $=$ "moptV0". Note that the derivative of the rho loss function, known as the "psi" function, is not the derivative of the rho polynomial,instead it is still the analytic optimal psi function whose formula is given in the second of the Vignettes referenced just below.

## Related Vignettes

For further details, see the Vignettes "Polynomial Opt and mOpt Rho Functions", and "Optimal Bias Robust Regression Psi and Rho".

```

## lmrobdetDCML

Robust Distance Constrained Maximum Likelihood estimators for linear regression

## Description

This function computes robust Distance Constrained Maximum Likelihood estimators for linear models.

## Usage

lmrobdetDCML(
formula, data, subset, weights, na.action, model = TRUE,
$x=$ !control\$compute. rd ,
$y=$ FALSE,
singular. ok = TRUE,
contrasts = NULL,
offset = NULL,
control = lmrobdet.control()
)

## Arguments

| formula | a symbolic description of the model to be fit. |
| :---: | :---: |
| data | an optional data frame, list or environment containing the variables in the model. If not found in data, model variables are taken from environment (formula), which usually is the root environment of the current R session. |
| subset | an optional vector specifying a subset of observations to be used. |
| weights | an optional vector of weights to be used in the fitting process. |
| na.action | a function to indicates what should happen when the data contain NAs. The default is set by the na.action setting of options, and is na. fail if that is unset. |
| model | logical value indicating whether to return the model frame |
| x | logical value indicating whether to return the model matrix |
| y | logical value indicating whether to return the vector of responses |
| singular.ok | logical value. If FALSE a singular fit produces an error. |
| contrasts | an optional list. See the contrasts.arg of model.matrix.default. |
| offset | this can be used to specify an a priori known component to be included in the linear predictor during fitting. An offset term can be included in the formula instead or as well, and if both are specified their sum is used. |
| control | a list specifying control parameters as returned by the function lmrobdet.control. |

## Details

This function computes Distance Constrained Maximum Likelihood regression estimators computed using an MM-regression estimator based on Pen~a-Yohai candidates (instead of subsampling ones). This function makes use of the functions lmrob.fit, lmrob..M..fit, .vcov.avar1, lmrob. S and lmrob.lar, from robustbase, along with utility functions used by these functions, modified so as to include use of the analytic form of the optimal psi and rho functions (for the optimal psi function, see Section 5.8.1 of Maronna, Martin, Yohai and Salibian Barrera, 2019)

## Value

A list with the following components:

| coefficients | The estimated vector of regression coefficients |
| :--- | :--- |
| scale | The estimated scale of the residuals |
| residuals | The vector of residuals associated with the robust fit <br> Logical value indicating whether IRWLS iterations for the MM-estimator have <br> converged |
| converged | Number of IRWLS iterations for the MM-estimator |
| iter | Robustness weights for the MM-estimator |
| rweightsMM | Fitted values associated with the robust fit |
| fitted.values | Numeric rank of the fitted linear model |
| rank | The estimated covariance matrix of the regression estimates <br> cov |
| df.residual The residual degrees of freedom <br> contrasts (only where relevant) the contrasts used <br> (only where relevant) a record of the levels of the factors used in fitting  |  |
| call | the matched call <br> model requested, the model frame used |
| $x$ | if requested, the model matrix used |
| $y$ | if requested, the response vector used |
| na.action | (where relevant) information returned by model.frame on the special handling <br> of NAs |

    lmrobdetLinTest Robust likelihood ratio test for linear hypotheses
    
## Description

This function computes a robust likelihood ratio test for linear hypotheses.

## Usage

lmrobdetLinTest(object1, object2)

## Arguments

object1 an lmrobdetMM or lmrobM object with the fit corresponding to the complete model
object2 an lmrobdetMM or lmrobM object with the fit corresponding to the model restricted under the null linear hypothesis.

## Value

A list with the following components: c("test","chisq.pvalue","f.pvalue","df")
test The value of the F-statistic
f.pvalue p-value based on the $F$ distribution
chisq.pvalue p-value based on the chi-squared distribution
df degrees of freedom

oats1M_var <- lmrobM(response1 ~ block, control=cont, data=oats)
( anov1M_var <- rob.linear.test(oats1M, oats1M_var) )
```

ImrobdetMM Robust Linear Regression Estimators

## Description

This function computes an MM-regression estimators for linear models using deterministic starting points.

## Usage

ImrobdetMM( formula, data, subset, weights, na.action, model = TRUE, $x=$ !control\$compute. rd , $y=$ FALSE, singular.ok = TRUE, contrasts $=$ NULL, offset = NULL, control = lmrobdet. control()
)

## Arguments

\(\left.\begin{array}{ll}formula \& a symbolic description of the model to be fit. <br>
an optional data frame, list or environment containing the variables in the model. <br>
If not found in data, model variables are taken from environment (formula), <br>

which usually is the root environment of the current R session.\end{array}\right\}\)| an optional vector specifying a subset of observations to be used. |
| :--- |
| subset |
| weights optional vector of weights to be used in the fitting process. |
| na.action | | a function to indicates what should happen when the data contain NAs. The |
| :--- |
| default is set by the na.action setting of options, and is na.fail if that is unset. |
| model |$\quad$| logical value indicating whether to return the model frame |
| :--- |
| logical value indicating whether to return the model matrix |

$$
\begin{array}{ll}
\text { y } & \text { logical value indicating whether to return the vector of responses } \\

\text { contrasts } & \begin{array}{l}
\text { an optional list. See the contrasts. arg of model.matrix.default. } \\
\text { offset }
\end{array} \\
\begin{array}{l}
\text { this can be used to specify an a priori known component to be included in the } \\
\text { linear predictor during fitting. An offset term can be included in the formula } \\
\text { instead or as well, and if both are specified their sum is used. }
\end{array} \\
\text { control } & \text { a list specifying control parameters as returned by the function lmrobdet.control. }
\end{array}
$$

## Details

This function computes MM-regression estimators computed using Pen~a-Yohai candidates (instead of subsampling ones). This function makes use of the functions lmrob.fit, lmrob. .M. .fit, .vcov. avar1, lmrob.S and lmrob. lar, from robustbase, along with utility functions used by these functions, modified so as to include use of the analytic form of the optimal psi and rho functions (for the optimal psi function, see Section 5.8.1 of Maronna, Martin, Yohai and Salibian Barrera, 2019).

## Value

A list with the following components:

| coefficients | The estimated vector of regression coefficients |
| :---: | :---: |
| scale | The robust residual M -scale estimate using the final residuals from the converged iterated weighted least square (IRWLS) algorithm final estimate |
| residuals | The vector of residuals associated with the robust fit |
| loss | Value of the objective function at the final MM-estimator |
| converged | Logical value indicating whether IRWLS iterations for the MM-estimator have converged |
| iter | Number of IRWLS iterations for the MM-estimator |
| rweights | Robustness weights for the MM-estimator |
| fitted.values | Fitted values associated with the robust fit |
| rank | Numeric rank of the fitted linear model |
| cov | The estimated covariance matrix of the regression estimates |
| df.residual | The residual degrees of freedom |
| degree.freedom | The residual degrees of freedom |
| scale. S | Minimum robust scale associated with the preliminary highly robust but inefficient S-estimator. |
| $r$ r.squared | The robust multiple correlation coefficient |
| adj.r.squared | The adjusted robust multiple correlation coefficient taking into account the degrees of freedom of each term |
| contrasts | (only where relevant) the contrasts used |
| $x \mathrm{levels}$ | (only where relevant) a record of the levels of the factors used in fitting |
| call | the matched call |

| model | if requested, the model frame used |
| :--- | :--- |
| $x$ | if requested, the model matrix used |
| $y$ | if requested, the response vector used |
| terms | The terms object used. |
| iters.py | The number of refinement iterations for each Pena-Yohai candidate for the S- <br> estimator. |
| iters.const | The number of refinement iterations used to compute the estimator without co- <br> variates (to calculate the robust $R^{\wedge} 2$ ). |
| assign | Used to separate continuous from categorical columns in the design matrix <br> (where relevant) information returned by model.frame on the special handling <br> of NAs |

## Choice of Rho Loss Function

This is done by the user choice of family $=$ "opt" or family $=$ "mopt" in the function lmrobdet.control. As of RobStatTM Versopm 1.0.7, the opt and mopt rhos functions are calculated using polynomials, rather than using the standard normal error function (erf) as in versions of RobStatTM prior to 1.0.7. The numerical results one now gets with the opt or mopt choices will differ by small amounts from those in earlier RobStatTM versions. Users who wish to replicate results from releases prior to 1.0 .7 may do so using the family arguments family $=$ "optV0" or family $=$ "moptV0". Note that the derivative of the rho loss function, known as the "psi" function, is not the derivative of the rho polynomial, instead it is still the optimal psi function referred to above.

## Related Vignettes

For further details, see the Vignettes "Polynomial Opt and mOpt Rho Functions", and "Optimal Bias Robust Regression Psi and Rho".

DCML, MMPY, SMPY

## Examples

```
data(coleman, package='robustbase')
m2 <- lmrobdetMM(Y ~ ., data=coleman)
m2
summary(m2)
```

## Description

This function computes the robust Final Prediction Errors (RFPE) for a robust regression fit using M-estimates.

## Usage

lmrobdetMM.RFPE (object, scale = NULL, bothVals = FALSE)

## Arguments

| object | an object of class lmrobdetMM or lmrobM. |
| :--- | :--- |
| scale | a numeric value specifying the scale estimate used to compute the RFPE. Usu- <br> ally this should be the scale estimate from an encompassing model. If NULL, the <br> scale estimate in object is used. |
| bothVals | a logical value: if TRUE the function returns the two terms of the RFPE expres- <br> sion separately (equation (5.39) in the reference book); otherwise, the value of <br> RFPE is returned. |

## Value

If the argument bothVals is FALSE, the robust final prediction error (numeric). Otherwise, the two terms of the RFPE expression in equation (5.39), Section 5.6.2 of Maronna et al. (2019), http://www.wiley.com/go/maronna/robust, are returned separately in a list with components named minRhoMM.C and penaltyRFPE

| contrasts | an optional list. See the contrasts. arg of model.matrix.default. |
| offset | this can be used to specify an a priori known component to be included in the linear predictor during fitting. An offset term can be included in the formula instead or as well, and if both are specified their sum is used. |
| control | a list specifying control parameters as returned by the function lmrobM.control. |

## Details

This function computes robust regression estimators for linear models with fixed designs. It computes an L1 estimator, and uses it as a starting point to find a minimum of a re-descending M estimator. The scale is set to a quantile of the absolute residuals from the L1 estimator. This function makes use of the functions lmrob.fit, lmrob. .M..fit, .vcov. avar1, lmrob.S and lmrob.lar, from robustbase, along with utility functions used by these functions, modified so as to include use of the analytic form of the optimal psi and rho functions (for the optimal psi function, see Section 5.8.1 of Maronna, Martin, Yohai and Salibian Barrera, 2019)

## Value

A list with the following components:

| coefficients | The estimated vector of regression coefficients |

lmrobM. control Tuning parameters for lmrobM

## Description

This function sets tuning parameters for the M estimators of regression implemented in 1 mrobM .

## Usage

lmrobM. control (
$\mathrm{bb}=0.5$,
efficiency $=0.99$,
family = "opt",
tuning.chi,
tuning.psi,
max.it = 100,
rel.tol $=1 \mathrm{e}-07$,
mscale_tol = 1e-06,
mscale_maxit = 50,
trace.lev $=0$
)

## Arguments

bb tuning constant (between 0 and $1 / 2$ ) for the M -scale used to compute the residual scale estimator. Defaults to 0.5 .
efficiency desired asymptotic efficiency of the final regression M-estimator. Defaults to 0.85 .
family string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt"). Incomplete entries will be matched to the current valid options.
tuning. chi tuning constant for the function used to compute the M-scale used for the residual scale estimator. If missing, it is computed inside lmrobdet. control to match the value of bb according to the family of rho functions specified in family.

| tuning.psi | tuning parameters for the regression M-estimator computed with a rho function <br> as specified with argument family. If missing, it is computed inside lmrobdet.control <br> to match the value of efficiency according to the family of rho functions <br> specified in family. Appropriate values for tuning.psi for a given desired <br> efficiency for Gaussian errors can be constructed using the functions bisquare, <br> mopt and opt. |
| :--- | :--- |
| max.it | maximum number of IRWLS iterations for the M-estimator <br> relative covergence tolerance for the IRWLS iterations for the M-estimator |
| mscale_tol | Convergence tolerance for the M-scale algorithm. See mscale. |
| mscale_maxit | Maximum number of iterations for the M-scale algorithm. See mscale. |
| trace.lev | positive values (increasingly) provide details on the progress of the M-algorithm |

## Value

A list with the necessary tuning parameters.

## Author(s)

Matias Salibian-Barrera, [matias@stat.ubc.ca](mailto:matias@stat.ubc.ca)

## Examples

```
data(coleman, package='robustbase')
m2 <- lmrobM(Y ~ ., data=coleman, control=lmrobM.control())
m2
summary(m2)
```

locScaleM

Robust univariate location and scale M-estimators

## Description

This function computes M-estimators for location and scale.

## Usage

locScaleM(x, psi = "mopt", eff $=0.95$, maxit $=50$, tol $=1 \mathrm{e}-04$, na.rm $=$ FALSE $)$

## Arguments

x
psi a string indicating which score function to use. Valid options are "bisquare", "huber", "opt" and "mopt".
eff desired asymptotic efficiency. Valid options are $0.85,0.9$ and 0.95 (default) when psi $=$ "bisquare" or "huber", and $0.85,0.9,0.95$ (default) and 0.99 when psi = "opt" or "mopt".
maxit maximum number of iterations allowed.
tol tolerance to decide convergence of the iterative algorithm.
na.rm a logical value indicating whether NA values should be stripped before the computation proceeds. Defaults to FALSE

## Details

This function computes M-estimators for location and scale.

## Value

A list with the following components:
mu The location estimate
std.mu Estimated standard deviation of the location estimator mu
disper M-scale/dispersion estimate

## Author(s)

Ricardo Maronna, [rmaronna@retina.ar](mailto:rmaronna@retina.ar)

## References

http://www.wiley.com/go/maronna/robust

## Examples

```
set.seed(123)
r <- rnorm(150, sd=1.5)
locScaleM(r)
# 10% of outliers, sd of good points is 1.5
set.seed(123)
r2 <- c(rnorm(135, sd=1.5), rnorm(15, mean=-10, sd=.5))
locScaleM(r2)
```

logregBY

Bianco and Yohai estimator for logistic regression

## Description

This function computes the M-estimator proposed by Bianco and Yohai for logistic regression. By default, an intercept term is included and p parameters are estimated. Modified by Yohai (2018) to take as initial estimator a weighted ML estimator with weights derived from the MCD estimator. For more details we refer to Croux, C., and Haesbroeck, G. (2002), "Implementing the Bianco and Yohai estimator for Logistic Regression"

## Usage

$\operatorname{logregBY}(x 0, y$, intercept $=1$, const $=0.5, k m a x=1000$, maxhalf $=10)$

## Arguments

$x 0 \quad$ matrix of explanatory variables;
$y \quad$ vector of binomial responses ( 0 or 1 );
intercept $\quad 1$ or 0 indicating if an intercept is included or or not
const tuning constant used in the computation of the estimator (default=0.5);
kmax maximum number of iterations before convergence (default=1000);
maxhalf max number of step-halving (default=10).

## Value

A list with the following components:
coefficients estimates for the regression coefficients
standard.deviation
standard deviations of the coefficients
fitted.values fitted values
residual.deviances
residual deviances
components logical value indicating whether convergence was achieved
objective value of the objective function at the minimum

## Author(s)

Christophe Croux, Gentiane Haesbroeck, Victor Yohai

## References

http://www.wiley.com/go/maronna/robust

## Examples

```
data(skin)
Xskin <- as.matrix( skin[, 1:2] )
yskin <- skin$vasoconst
skinBY <- logregBY(Xskin, yskin, intercept=1)
skinBY$coeff
skinBY$standard.deviation
```

## Description

This function computes the weighted M -estimator of Bianco and Yohai in logistic regression. By default, an intercept term is included and p parameters are estimated. Modified by Yohai (2018) to take as initial estimator a weighted ML estimator computed with weights derived from the MCD estimator of the continuous explanatory variables. The same weights are used to compute the final weighted M-estimator. For more details we refer to Croux, C., and Haesbroeck, G. (2002), "Implementing the Bianco and Yohai estimator for Logistic Regression"

## Usage

$\operatorname{logregWBY}(x 0, y$, intercept $=1$, const $=0.5, \mathrm{kmax}=1000$, maxhalf $=10)$

## Arguments

$x 0 \quad$ matrix of explanatory variables;
$y \quad$ vector of binomial responses ( 0 or 1 );
intercept $\quad 1$ or 0 indicating if an intercept is included or or not
const tuning constant used in the computation of the estimator (default=0.5);
kmax maximum number of iterations before convergence (default=1000);
maxhalf max number of step-halving (default=10).

## Value

A list with the following components:
coefficients estimates for the regression coefficients
standard.deviation
standard deviations of the coefficients
fitted.values fitted values
residual.deviances
residual deviances
components logical value indicating whether convergence was achieved
objective value of the objective function at the minimum

```

logregWML Weighted likelihood estimator for the logistic model

## Description

This function computes a weighted likelihood estimator for the logistic model, where the weights penalize high leverage observations. In this version the weights are zero or one.

## Usage

$\operatorname{logregWML}(\mathrm{x} 0, \mathrm{y}$, intercept $=1)$

## Arguments

| x 0 | pxn matrix of explanatory variables, p is the number of explanatory variables, |
| :--- | :--- |
| n is the number of observations |  |,

## Value

A list with the following components:
coefficients vector of regression coefficients
standard.deviation
standard deviations of the regression coefficient estimators
fitted.values vector with the probabilities of success
residual.deviances
residual deviances
cov covariance matrix of the regression estimates
objective value of the objective function at the minimum
xweights vector of zeros and ones used to compute the weighted maimum likelihood estimator

MMPY

\section*{Description}

This function computes MM-regression estimator using Pen~a-Yohai candidates for the initial Sestimator. This function is used internally by lmrobdetMM, and not meant to be used directly.

\section*{Usage}

MMPY(X, y, control, mf)

\section*{Arguments}
\begin{tabular}{ll}
X & design matrix \\
y & response vector \\
control & a list of control parameters as returned by lmrobdet.control \\
mf & model frame
\end{tabular}

\section*{Value}
an lmrob object witht the M-estimator obtained starting from the S-estimator computed with the Pen~a-Yohai initial candidates. The properties of the final estimator (efficiency, etc.) are determined by the tuning constants in the argument control.

\section*{Author(s)}

pcaRobS Robust principal components

```

\section*{Description}

This function computes robust principal components based on the minimization of the "residual" M-scale.

\section*{Usage}
pcaRobS(X, ncomp, desprop \(=0.9\), deltasca \(=0.5\), maxit \(=100\) )

\section*{Arguments}
\begin{tabular}{ll}
\(X\) & a data matrix with observations in rows. \\
ncomp & desired (maximum) number of components \\
desprop & desired (minimum) proportion of explained variability (default \(=0.9)\) \\
deltasca & "delta" parameter of the scale M-estimator \((\) default=0.5) \\
maxit & maximum number of iterations \((\) default \(=100)\)
\end{tabular}

\section*{Value}

A list with the following components:
\(\mathrm{q} \quad\) The actual number of principal components
propex The actual proportion of unexplained variability
eigvec \(\quad\) Eigenvectors, in a p x q matrix
fit an \(n \times p\) matrix with the rank-q approximation to \(X\)
repre An \(n \times q\) matrix with representation of data in \(\mathrm{R}^{\wedge} \mathrm{q}\) (scores)
propSPC A vector of length \(p\) with the cumulative explained variance from initial SPC

    ```
    refine.sm
        IRWLS iterations for \(S\) - or M-estimators

\section*{Description}

This function performs iterative improvements for S - or M-estimators.

\section*{Usage}
refine.sm(
x ,
\(y\),
initial.beta,
initial.scale,
\(k=50\),
conv \(=1\),
b,
cc,
family,
step \(=\) "M",
tol
)

\section*{Arguments}
x
\(y \quad\) vector of responses
initial.beta vector of initial regression estimates
initial.scale initial residual scale estimate. If missing the (scaled) median of the absolute residuals is used.
k maximum number of refining steps to be performed
conv an integer indicating whether to check for convergence (1) at each step, or to force running k steps ( 0 )
b tuning constant for the M-scale estimator, used if iterations are for an S-estimator.
\begin{tabular}{ll} 
CC & tuning constant for the rho function. \\
family & \begin{tabular}{l} 
string specifying the name of the family of loss function to be used (current valid \\
options are "bisquare", "opt" and "mopt")
\end{tabular} \\
step & \begin{tabular}{l} 
a string indicating whether the iterations are to compute an S-estimator ('S') or \\
an M-estimator ('M')
\end{tabular} \\
tol & \begin{tabular}{l} 
tolerance to detect convergence (relative difference of consecutive vectors of \\
parameters)
\end{tabular}
\end{tabular}

\section*{Details}

This function performs iterative improvements for S- or M-estimators. Both iterations are formally the same, the only difference is that for M-iterations the residual scale estimate remains fixed, while for \(S\)-iterations it is updated at each step. In this case, we follow the Fast-S algorithm of SalibianBarrera and Yohai an use one step updates for the M-scale, as opposed to a full computation. This as internal function.

\section*{Value}

A list with the following components:
\begin{tabular}{ll} 
beta.rw & The updated vector of regression coefficients \\
scale.rw & The corresponding estimated residual scale \\
converged & A logical value indicating whether the algorithm converged
\end{tabular}

rho Rho functions

\section*{Description}

This function returns the value of the "rho" loss function used to compute either an M-scale estimator or a robust regression estimator. It currently can be used to compute the bisquare, optimal and modified optimal loss functions.

\section*{Usage}
rho(u, family = " bisquare", cc, standardize = TRUE)

\section*{Arguments}
u
point or vector at which rho is to be evaluated
family family string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt").
cc tuning parameters to be computed according to efficiency and / or breakdown considerations. See lmrobdet.control, bisquare, mopt and opt.
standardize logical value determining whether the rho function is to be standardized so that its maximum value is 1 . See Mpsi.

\section*{Value}

The value(s) of rho at \(u\)

\section*{Author(s)}

Matias Salibian-Barrera, <matias@stat.ubc.ca>

\section*{Examples}
```

    # Evaluate rho tuned for 85% efficiency
    rho(u=1.1, family='bisquare', cc=bisquare(.85))
    # Evaluate rho tuned for 50% breakdown
    rho(u=1.1, family='opt', cc=lmrobdet.control(bb=.5, family='opt')$tuning.chi)
    ```
    rhoprime The first derivative of the rho function

\section*{Description}

The first derivative of the rho function

\section*{Usage}
rhoprime(u, family, cc, standardize = FALSE)

\section*{Arguments}
u
family family string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt").
cc tuning parameters to be computed according to efficiency and / or breakdown considerations. See lmrobdet.control, bisquare, mopt and opt.
standardize logical value determining whether the rho function is to be standardized so that its maximum value is 1 . See Mpsi.

\section*{Value}

The value of the first derivative rho evaluated at \(u\)

\section*{Author(s)}

Matias Salibian-Barrera, <matias@stat.ubc.ca>

\section*{Examples}
```

# Evaluate the derivative of a rho function tuned for 85% efficiency

rhoprime(u=1.1, family='bisquare', cc=bisquare(.85))

# Evaluate the derivative of a rho function tuned for 50% breakdown

rhoprime(u=1.1, family='opt', cc=lmrobdet.control(bb=.5, family='opt')\$tuning.chi)

```
rhoprime2 The second derivative of the rho function

\section*{Description}

The second derivative of the rho function

\section*{Usage}
rhoprime2(u, family, cc, standardize = FALSE)

\section*{Arguments}
\begin{tabular}{ll} 
u & point or vector at which rho is to be evaluated \\
family & \begin{tabular}{l} 
family string specifying the name of the family of loss function to be used (cur- \\
rent valid options are "bisquare", "opt" and "mopt").
\end{tabular} \\
cc & \begin{tabular}{l} 
tuning parameters to be computed according to efficiency and / or breakdown \\
considerations. See lmrobdet.control, bisquare, mopt and opt.
\end{tabular} \\
standardize & \begin{tabular}{l} 
logical value determining whether the rho function is to be standardized so that \\
its maximum value is 1. See Mpsi.
\end{tabular}
\end{tabular}

\section*{Value}

The value of the second derivative of rho evaluated at \(u\)

\section*{Author(s)}

Matias Salibian-Barrera, <matias@stat.ubc.ca>

\section*{Examples}
```

# Evaluate the 2nd derivative of a rho function tuned for 85% efficiency

rhoprime2(u=1.1, family='bisquare', cc=bisquare(.85))

# Evaluate the 2nd derivative of a rho function tuned for 50% breakdown

rhoprime2(u=1.1, family='opt', cc=lmrobdet.control(bb=.5, family='opt')\$tuning.chi)

```
scaleM M-scale estimator

\section*{Description}

This function computes an M-scale, which is a robust scale (spread) estimator. M-estimators of scale are a robust alternative to the sample standard deviation. Given a vector of residuals \(r\), the M-scale estimator \(s\) solves the non-linear equation mean \((r h o(r / s, c c))=b\), where \(b\) and \(c c\) are user-chosen tuning constants. In this package the function rho is one of Tukey's bisquare family. The breakdown point of the estimator is \(\min (b, 1-b)\), so the optimal choice for \(b\) is 0.5 . To obtain a consistent estimator the constant cc should be chosen such that \(\mathrm{E}(\mathrm{rho}(\mathrm{Z}, \mathrm{cc}))=\mathrm{b}\), where Z is a standard normal random variable.
```

Usage
scaleM(
u,
delta = 0.5,
tuning.chi = 1.547645,
family = "bisquare",
max.it = 100,
tol = 1e-06,
tolerancezero = .Machine\$double.eps
)

```

\section*{Arguments}
u
delta
tuning.chi
family string specifying the name of the family of loss function to be used (current valid options are "bisquare", "opt" and "mopt").
max.it maximum number of iterations allowed
tol relative tolerance for convergence
tolerancezero smallest (in absolute value) non-zero value accepted as a scale. Defaults to .Machine\$double.eps

\section*{Details}

The iterative algorithm starts from the scaled median of the absolute values of the input vector, and then cycles through the equation \(\mathrm{s}^{\wedge} 2=\mathrm{s}^{\wedge} 2 * \operatorname{mean}(\mathrm{rho}(\mathrm{r} / \mathrm{s}, \mathrm{cc})) / \mathrm{b}\).

\section*{Value}

The scale estimate value at the last iteration or at convergence.

\section*{Author(s)}

Matias Salibian-Barrera, <matias@stat.ubc.ca>

\section*{Examples}
```

set.seed(123)
r <- rnorm(150, sd=1.5)
mscale(r)
sd(r)

# 10% of outliers, sd of good points is 1.5

set.seed(123)
r2 <- c(rnorm(135, sd=1.5), rnorm(15, mean=-5, sd=.5))
mscale(r2)
sd(r2)

```
shock Shock data

\section*{Description}

Times recorded for a rat to go through a shuttlebox in successive attempts. If the time exceeded 5 seconds, the rat received an electric shock for the duration of the next attempt. The data are the number of shocks received and the average time for all attempts between shocks.

\section*{Usage}
data(shock)

\section*{Format}

An object of class "data.frame".

```

step.lmrobdetMM Robust stepwise using RFPE

```

\section*{Description}

This function performs stepwise model selection on a robustly fitted linear model using the RFPE criterion and the robust regression estimators computed with lmrobdetMM. Only backwards stepwise is currently implemented.

\section*{Usage}
```

step.lmrobdetMM(
object,
scope,
direction = c("both", "backward", "forward"),
trace = TRUE,
keep = NULL,
steps = 1000,
whole.path = FALSE
)

```

\section*{Arguments}

> object
a robust fit as returned by lmrobdetMM
scope either a formula or a list with elements lower and upper each of which is a formula. The terms in the right-hand-side of lower are always included in the model and the additional terms in the right-hand-side of upper are the candidates for inclusion/exclusion from the model. If a single formula is given, it is taken to be upper, and lower is set to the empty model. The . operator is interpreted in the context of the formula in object.
direction the direction of stepwise search. Currenly only backward stepwise searches are implemented.
trace logical. If TRUE information about each step is printed on the screen.
keep a filter function whose input is a fitted model object and the associated AIC statistic, and whose output is arbitrary. Typically keep will select a subset of the components of the object and return them. The default is not to keep anything.
steps maximum number of steps to be performed. Defaults to 1000, which should mean as many as needed.
whole. path if FALSE (default) variables are dropped until the RFPE fails to improve. If TRUE the best variable to be dropped is removed, even if this does not improve the RFPE.

\section*{Details}

Presently only backward stepwise selection is supported. During each step the Robust Final Prediction Error (as computed by the function lmrobdetMM. RFPE) is calculated for the current model and for each sub-model achievable by deleting a single term. If the argument whole. path is FALSE, the function steps to the sub-model with the lowest Robust Final Prediction Error or, if the current model has the lowest Robust Final Prediction Error, terminates. If the argument whole.path is TRUE, the function steps through all smaller submodels removing, at each step, the variable that most reduces the Robust Final Prediction Error. The scale estimate from object is used to compute the Robust Final Prediction Error throughout the procedure.

\section*{Value}

If whole. path \(==\) FALSE the function returns the robust fit as obtained by lmrobdetMM using the final model. If whole. path \(==\) TRUE a list is returned containing the RFPE of each model on the sequence of submodels. The names of the components of this list are the formulas that correspods to each model.

data(waste)

```
wine Wine data

\section*{Description}

It contains, for each of 59 wines grown in the same region in Italy, the quantities of 13 constituents. The original purpose of the analysis was to classify wines from different cultivars by means of these measurements. In this example we treat cultivar one.

\section*{Usage}
data(wine)

\section*{Format}

An object of class "data.frame".

\section*{Details}

Format: Numeric, 59 rows and 13 columns. Description: The attributes are: 1. Alcohol 2. Malic acid 3. Ash 4. Alcalinity of ash 5. Magnesium 6. Total phenols 7. Flavanoids 8. Nonflavanoid phenols 9. Proanthocyanins 10. Color intensity 11. Hue 12. OD280/OD315 of diluted wines 13. Proline
wine
